

The role of forests in addressing Climate Change in the Mediterranean

Prof. Riccardo Valentini University of Tuscia, Viterbo, Italy and CMCC
RUDN University, Moscow, Russia

The future of Climate Scenarios

In the lead up to the IPCC's Sixth Assessment Report new scenarios have been developed to more systematically explore key uncertainties in future socioeconomic developments

Fate of anthropogenic CO₂ emissions (2007–2016)

FLUXNET: A Global Network of Observation Sites

500+ Sites, 10 Regional Networks, 45 Countries

Quantify and understand causes of variation in terrestrial exchange of carbon, water and energy with atmosphere

www.fluxdata.org

First global GPP estimate by FLUXNET (Beer et al. 2010) ($123 \pm 8 \text{ Pg Cy}^{-1}$)

Large and Consistent Global Forest Carbon Sink

Global Forest Carbon Balance, 2000-2007

Forest land

Biome	(Pg C yr ⁻¹)
Boreal	0.5 ± 0.1
Temperate	0.8 ± 0.1
Tropical (intact)	1.0 ± 0.5
Total	2.3 ± 0.5

1.3 Pg C yr⁻¹

LUC in tropics

Land class	(Pg C yr ⁻¹)
Deforestation emissions	-2.8 ± 0.5
Regrowth (after LUC)	1.7 ± 0.5
Total	-1.1 ± 0.7

-0.1 Pg C yr⁻¹

Global *net* forest sink = 1.2 ± 0.9
(Net sinks in temperate and boreal zones)

How to bridge the gap: results from sectoral policy analysis*

*based on results from Bridging the Emissions Gap Report 2011

**including shipping and aviation

Achieving 2°C target

BECCS (Biomass Energy with Capture and Storage)

3.3. Gt C y⁻¹ 170 EJ y⁻¹ (30% of fossil fuel emissions)

Cumulative 160 GtC by 2100

380-700 Mha of land = 50 % present cropland

Forest based land mitigation

0.6 – 2 GtC y⁻¹

>320 Mha new forests

Mediterranean forests Area = **85 M ha** (2% of world forest area)

Mediterranean forest growing stock = 9623 million m³ $\approx$ **5 Gt C**

Mediterranean forest carbon sequestration (biomass)@1990-2010 $\approx$ **0.06 Gt C y⁻¹**

Mediterranean GHG emissions@2010 = 2,487 Mt CO₂eq Forest sink $\approx$ **9% emissions**

Figure 2.1. Extent of forest area in Mediterranean countries, 2010
Source: FAO, 2010b.

Increased carbon sequestration by land use management in Mediterranean forest

(Ruiz-Peinado et al. 2017)

(Munoz-Rojas et al. 2016)

Thinning

(light versus unthinned/heavily thinned)

5-10% C ha⁻¹

Extending rotation period (20-30 y)

6-37% C ha⁻¹

Soil carbon changes

(reforestation/afforestation)

-10 + 45% C ha⁻¹

Climate effects of deforestation (Cooling or Heating ?) *Duveiller et al. 2018*

$\Delta T = 0.23 \pm 0.03^{\circ}\text{C}$
(2000-2015)

The impact of Reforestation – non radiative cooling effects at low latitude (Bright *et al.* 2017)

The Mediterranean – a specific case

Figure S.1.

Historic warming of the atmosphere (annual mean temperature anomalies with respect to the period 1880-1899), in the Mediterranean Basin (blue lines, with and without smoothing) and for the globe (green line). Data from Berkeley Earth available at <http://berkeleyearth.org/>

Mediterranean - a hot-spot of climate change - hotter, dryer

1.5 versus 2.0 °C in Mediterranean region

C.-F. Schleussner et al.: Climate impacts at 1.5 °C and 2 °C

345

	1.5 °C	2 °C		
Heat wave (warm spell) duration [month]				
Global	1.1 [1.1,3]	1.5 [1.4,18]	Tropical regions up to 2 months at 1.5 °C or up to 3 months at 2 °C	
Reduction in annual water availability [%]				
Mediterranean	9 [5,16]	17 [8,23]	Other dry subtropical regions like Central America and South Africa also at risk	
Increase in heavy precipitation intensity [%]				
Global	5 [4,6]	7 [5,7]	Global increase in intensity due to warming; high latitudes (>45 °N) and monsoon regions affected most.	
South Asia	7 [4,8]	10 [7,14]		
Global sea-level rise				
in 2100 [cm]	40 [30,55]	50 [35,65]	1.5 °C end-of-century rate about 30 % lower than for 2 °C reducing long-term SLR commitment.	
2081–2100 rate [mm/yr]	4 [3,5.5]	5.5 [4,8]		
Fraction of global coral reefs at risk of annual bleaching [Constant case, %]				
2050	90 [50,99]	98 [86,100]	Only limiting warming to 1.5 °C may leave window open for some ecosystem adaptation.	
2100	70 [14,93]	99 [85,100]		
Changes in local crop yields over global and tropical present day agricultural areas including the effects of CO ₂ -fertilization [%]				
Wheat	Global	2 [-6,17]	0 [-8,21]	Projected yield reductions are largest for tropical regions, while high-latitude regions may see an increase. Projections not including highly uncertain positive effects of CO ₂ -fertilization project reductions for all crop types of about 10 % globally already at 1.5 °C and further reductions at 2 °C.
	Tropics	-9 [-25,12]	-16 [-42,14]	
Maize	Global	-1 [-26,8]	-6 [-38,2]	
	Tropics	-3 [-16,2]	-6 [-19,2]	
Soy	Global	7 [-3,23]	1 [-12,34]	
	Tropics	6 [-3,23]	7 [-5,27]	
Rice	Global	7 [-17,24]	7 [-14,27]	
	Tropics	6 [0,20]	6 [0,24]	

Figure 15. Summary of key differences in climate impacts between a warming of 1.5 °C and 2 °C above pre-industrial and stylized 1.5 °C and 2 °C scenarios over the 21st century. Square brackets give the likely (66 %) range.

Global Tree Mortality : Climate Risk?

Are pest and diseases a threat to carbon mitigation potential ?

Table 3 Equilibrium C cycle effects of a potential invasive alien disturbance regime compared to the natural disturbance regime in Europe

		Current climate (Tg C)	Future climate (Tg C)
Invasive alien disturbance regime	ALB—Asian Long-horned Beetle	246.0	252.0
	PWN—Pine Wood Nematode	188.4	291.2
	SOD—Sudden Oak Death	9.0	32.7
	BBC—Beech Bleeding Canker	5.7	11.7
	PPC—Pitch Pine Canker	10.4	46.5
	All	308.7	392.6
Natural disturbance regime	Wind, native bark beetles, and wildfires	319.8	503.4

Values indicate the long-term reduction of total ecosystem C storage capacity in Europe’s forests due to disturbance (Tg C). For invasive alien pests, the implementation of effective pest management measures is considered under both current climate (1950–2000) and future climate (RCP 4.5, 2030–2080), as also natural disturbance risk is commonly managed in Europe’s forests. Values for the natural disturbance regime of Europe are taken from Seidl et al.⁶ and refer to observations for 1971–2010 (current climate) and the median projection for an ensemble of 12 climate change scenarios for 2021–2030. Please note that, while methodologically similar, the reference periods and climate scenarios differ between the assessments of invasive alien and natural disturbance regimes. All: upper bound of the equilibrium C cycle effect from all five invasive alien pests jointly

Moving forward forest monitoring

Can we monitor all ?

IoT – Big Data Analytics

The Revolution Project

The TreeTalker concept

- Water transport inside the plant
- Diameter growth
- Foliage Health (light transmission in 12 spectral bands)
- Climate and soil parameters (temperature, humidity).
- Tree stability with gyroscopic sensor
- Air temperature and humidity
- Soil temperature and humidity

The TreeTalker is *connected wireless* (using powerful low power chipset LoRa or SIG-FOX) *to a node managed by another microcontroller (TT-CLOUD)* serving up to 48 devices in one cluster (we suggest 20 to avoid data collision) .

The **TT-CLOUD** is then connected via modem to a GPRS network and internet connected to a computer server.

The TreeTalker is running with high efficient Li-Io batteries and solar panels. Depending from application it can run from **1 month** to **1 year**, depending on solar availability.

CONCLUSIONS 1/2

Mediterranean Forests Climate Pathways

CONCLUSIONS 2/2

1. Land based mitigation potential is fundamental for achieving the 2 and even more 1.5 ° C targets but we cannot ask more to land – decarbonization still needed !
2. Mediterranean forests have a large mitigation potential due to soil accumulation and biomass growth
3. Additional climate benefits are shown for non – radiative cooling of afforestation/reforestation in Mediterranean region
4. Lack of integrated pan- Mediterranean studies for mitigation potential including wood products and energy substitution
5. We need a rapid deployment of IoT technologies in the forestry sector (Nature 4.0)
3. The reaching of reference level in GHG accounting (EU directive and beyond) is a great opportunity for designing a “new Mediterranean forest sustainable pathways”.
